                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a fusion polypeptide comprising a von Willebrand factor A-like domain (vWP) amino acid sequence and an amino acid sequence heterologous to the vWP. Also described are: a method of preventing or ameliorating a symptom of anthrax in a subject thought to be at risk for exposure to or suspected of having been exposed to Bacillus anthracis; and a pharmaceutical composition comprising the novel fusion polypeptide. The composition and method are useful in preventing or ameliorating symptoms of cutaneous and/or inhalation anthrax. This is the amino acid sequence of a fusion protein comprising human TANGO197, thrombin cleavage site and his tag that can be used to treat exposure to or prevent a symptom of anthrax.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is the protein sequence of a human surface-bound anthrax toxin receptor (ATR), as predicted from an isolated CDNA clone. Anthrax toxin protective antigen (PA) binds to the ATR at a von willebrand factor A domain located in the extracellular domain of ATR. The invention provides ATR polypeptides and polynucleotides, vectors, host cells, and transgenic and knock-out animals. It also provides methods for identifying molecules that bind the ATR and which reduce the coxicity of anthrax toxin. A claimed method for treating anthrax in a human or animal involves administering an agent that inhibits binding between PA and ATR at a level effective to reduce the severity of anthrax. Suitable agents include ATR or a PA-binding fragment of ATR, a PA-binding polypeptide at least 80% identical to these, a fusion protein,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a fusion polypeptide comprising a von Willebrand factor A-like domain (wwF) amino acid sequence and an amino acid sequence heterologous to the wWF. Also described are: a method of preventing or ameliorating a symptom of anthrax in a subject thought to be at risk for exposure to or suspected of having been exposed to Bacillus anthracis; and a pharmaceutical composition comprising the novel fusion polypeptide. The composition and method are useful in preventing or ameliorating symptoms of cutaneous and/or inhalation anthrax. This is the amino acid sequence of a fusion protein comprising human TANGO197 extracellular region, minus the DG residues closest to the transmembrane region, and immunoglobulin G (IGG) fragment of crystallisation (FC) with mutations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 384
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New TANGO 197 and/or TANGO 216 fusion polypeptides for preventing or ameliorating symptoms of anthrax comprises a von Willebrand factor A-like domain (vWF) amino acid sequence and an amino acid sequence heterologous

(HUMA-) HUMAN GENOME SCI INC.

Ruben SM, Komatsoulis GA, Moore PA, Birse É Z.

2001-308778/32.

New nucleic acid molecules encoding 28 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions used as food additives or preservatives. and

Claim 11; Page 485-486; 562pp; English.

CC AAD05300-AAD05379 represent cDNAs corresponding to 28 human secreted CC protein genes, and AAE0146-AAE01513 represent the proteins they encode. CC AAE01514-AAE01544 represent human secreted protein fragments or variants. CC The genes and their secreted proteins are useful for preventing, treating cor ameliorating medical conditions, e.g., by protein or gene therapy. CC Pathological conditions can be diagnosed by determining the amount of the new genes. Specific uses are described for each of the 28 genes, the new genes. Specific uses are described for each of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, cc cognitive disorders, schizophrenia, asthma, skin disorders (e.g., cognitive disorders, schizophrenia, asthma, skin disorders, cardiovascular disorders, cognitive disorders, endocrine disorders, gastrointestinal disorders, cognificated disorders, endocrine disorders, and include cognistic transplantation, for supporting cell culture of primary tissues, cordiopance tissues, to identify their cognate ligands or binding parterion of the invention can be used to all wound healing and epithelial cell correction of the invention can be used in allevateing symptoms associated correction of the invention a human secreted protein of the invention can be used in macrote to filmunoassays e.g., cardioimmunoassays or enzyme linked immunoasorbent assay (ELISA). The invention can be used in allevatein of the invention represents a human secreted protein of invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches 173;
The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HAA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, digestive disorders (e.g. Crohn's disease, ulcerative colitie), immune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrined so (e.g. diabetes), haematopoietic disorders, neural disorders (e.g. Alzheimer's, haematopoietic disorders, neural disorders (e.g. Alzheimer's, meningitis, parkinson's, Creutzfeldt-Jacob disease, encephalomyelitis, meningitis,
                                                                                                                                                                                                                                                                                                                                                                                                                                       New fusion protein for treating disease e.g. diabetes comprises albumin fused to a therapeutic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       12-APR-2000; 2000US-0229358P

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               B B

C;Complex: The proenzyme forms a complex with C4a and is activated by cleavag
C;Function:
C;Complex: The proenzyme forms a complement C3 and complement C5 alpha chains
A;Description: cleaves complement C3 and complement C5 alpha chains
A;Description: cleaves complement C3 and complement Factor H repeat homology; trypsin
C;Keywords: alternative splicing; complement classical pathway; duplication;
F;13-280/Droduct: complement C2b fragment #status predicted <C2B>
F;13-280/Domain: complement factor H repeat homology <FH1>
F;24-819/Domain: complement factor H repeat homology <FH2>
